

STONELOCK

Facial Recognition at Its Finest The StoneLock Identity Heatmap

As part of the StoneLock **True Frictionless™** Solution delivering a hassle-free user experience with 1:N capability for up to 20,000 users, StoneLock uses our proprietary identity heatmap to demonstrate individuals' **unique biometric identifiers**. The heatmap visualization reveals the distinctive nature of StoneLock's facial recognition technology, including the way we **protect user identity**.

StoneLock technology uses near-infrared wavelengths that are safe, invisible to the eye and go below the skin for spectroscopic measurement of intrinsic properties like shape, reflectivity and expression, totally unique to one's identifiers. As the identity heatmap demonstrates, StoneLock captures information that cannot be seen visually with conventional photographs, meaning what users share with us cannot be used against the user as conventional PII. Furthermore, our identity heatmap demonstrates user data to be rendered visually unrecognizable, which makes our biometric template effectively pseudonymized in terms of the new European **GDPR privacy standard**.

This is how StoneLock Sees You

- ▶ This is not a thermal heatmap, but a unique StoneLock Identity Heatmap
- ▶ The StoneLock Identity Heatmap is a representation of the unique identifiers in StoneLock's biometric template
- ▶ The "hotter" the point, the greater uniqueness from the rest of the enrolled users
- ▶ The heatmap represents 5% of a user's facial features, making the data visually unrecognizable
